

2-9

1. Computer Science

2. 6

3.

1. Outcome 1: Neither agree nor disagree. I think when given real world problems there are some subdisciplines where I can solve them, namely cyber security and embedded. However when it comes to anything related to software engineering, I don't think I learned enough to provide any solution. I didn't learn about CDNs, load balancing, barely anything about DNS, etc.
2. Outcome 2: Slightly disagree: I think I have the ability to implement a solution based on a design but I do not have the ability to design or evaluate anything. For example I have the ability to implement a database, but I do not know how to design one. I know how to use SQL, but I don't know how it works so I can't evaluate it.
3. Outcome 3: Strongly agree: We have had many group projects and I feel comfortable communicating
4. Outcome 4: Slightly agree: I had 2 lectures on ethics and while they were very good and engaging, I honestly wish we had more.
5. Outcome 5: Strongly agree: Again we had many group projects and I was the de facto leader and it went well for the most part.
6. Outcome 6: Strongly disagree: Yet again, I feel like (aside from embedded), I know how to use common concepts like encryption and databases, but I don't know the theory behind them. I don't B-trees, and modern algorithms, math behind ML, etc. I do not have the theory but if given a design, I think I can implement it.
